SEMESTER 2 2025/2026

SECP3106 - APPLICATION DEVELOPMENT

SECTION 1

LAB ASSIGNMENT 1 REPORT:

DAILY ACTIVITIES RECORDER APP

LECTURER: DR. AHMAD NAJMI BIN AMERHAIDER NUAR

NAME	MATRIC NUMBER
NURUL IKA SYAFINY BINTI AZHAR	A23CS0164

1.0 Objectives

- Understanding Flutter project structure.
- Implementing Widgets and layouts.
- Managing application state using the setState() method.
- Handling user input via TextField.
- Displaying dynamic data using a ListView.

2.0 Brief Description of The System

The "Daily Activities Recorder App" is a mobile application designed to help users track their daily tasks. It allows users to input the name of an activity along with a specific time or category. The system stores these entries in a list that is displayed on the main screen, providing a simple and clear way to organize a daily schedule without the need for a complex database.

3.0 Explanation of The Interface

- **Activity Input Field:** A TextField where the user types the name of the task (e.g., "Study Flutter").
- **Time/Category Input Field:** A second TextField used to specify when the activity occurs or what type of activity it is (e.g., "8:00 PM" or "Exercise").
- **Add Button:** An ElevatedButton that, when pressed, triggers the setState() method to add the user's input to the internal list and refresh the UI.
- **Activity List:** A ListView widget that dynamically generates cards for each recorded activity, displaying the name and time/category clearly.
- **Delete Button:** An icon button attached to each list item that allows the user to remove specific activities from the list using the removeAt logic within a setState() call.

5.0 Conclusion

This assignment successfully demonstrates the core principles of Flutter's reactive framework. By using `StatefulWidget` and `setState()`, the app effectively captures user input and updates the display in real-time. This project serves as a solid foundation for more advanced Flutter topics, such as persistent storage and complex state management.
